Ikhsanova, V. N.
THE INTENSE RADIO OUTBURST OF 23 MAR 58.
tr. by T. A. Narotov. [1960] 4p. 4 refs. CSIRO Trans. no. 5067
Order from I.P.S. of S.I.A. ml$1.80, ph$1.80 61-15230

Trans. of Solnechnyye Dannyye (USSR) 1959, no. 5, p. 80-85.

From the descriptions of the outburst and the measurements carried out it is concluded that the outburst occurred in a coronal condensation above the sunspot group [illegible] with an area of 1790 millionths of the solar hemisphere. The outburst maximum was within 1 [illegible], which coincides with the period for the maximum of the chromospheric flare. The angular dimension of the radiating region can be taken equal to 2.5 in the E-W direction. The aerial temperature in the first eastern diffraction lobe was 30,000°K. Hence, at 10.07 m the aerial temperature of the outburst was about 3×10^{9} °K, and the brightness (Astronomy--Astrophysics, TT, v. 5, no. 5) (over)

Neshpor, Yu. I.
A SUDDEN INCREASE IN ABSORPTION OF THE COSMIC RADIO EMISSION AT 30 Mc/s ON 28TH AUGUST AND 14TH SEPTEMBER, 1958, tr. by P. A. Parkhor. [1961] 2p. 5 refs. [CSIRO] Trans. 5251.
Order from LC or SLA mi$1.80, ph$1.80 61-19372

Trans. of Solnechnyye Dannyye (USSR) 1959, no. 9, p. 86-89.

A method for measuring the absorption of radio emission is described that is based on the method of Gardner [sic]; the cosmic radio emission intensity at a fixed frequency, which should be higher than the critical frequency of the F_2 layer. The approximate relation of Whitehead and Zirin (J. Atm. Terr. Phys. II, 182, 1957) for the relative change in the mean electron concentration in the D layer was found to lead to significant error.
